

Production of a beer mug lid

Beer mug lid

Don't give insects a chance and protect your beer! With this unique beer mug lid, your mug content remains protected from any insect attack and it will certainly be the hit at every garden party.

The contour was converted from the DXF file with the help of the CAD reader into ShopTurn programs. These programs are processed by the contour milling cycle.

All information, tool data and ShopTurn machining plans required for the reproduction are summarized in the following sections.

1. Safety note

The handling of machines brings many dangers. Consequently, the legal and general company safety regulations must always be observed for the production of the beer mug lid.

2. Preliminary remark

The following description is oriented to technicians familiar with a CNC turning machine who have experience or knowledge of the SINUMERIK CNC with ShopTurn. All technology data listed here is appropriate for the machines, tools, materials, machining plans and drawings used to produce the sample. Although the wide range of conditions prevailing in other workshops mean they are only exemplary for a reproduction, in most cases they should allow a problem-free reproduction.

ShopTurn permits the turning of the beer mug lid using just two clampings. The rear side of the beer mug lid is produced in the first clamping. The concave inner side is bored and a shoulder machined.

In the second clamping, a convex surface is turned and the fly contour milled. The wide range of possibilities of the turning program are by no means exhausted in this step. For example, it would be possible without additional clamping to use the program's engraving function to engrave an arbitrary text.

A cut round stock with a diameter of approximately 100 mm and a thickness of approximately 30 mm is used as raw material.

To guarantee success, we recommend simulating the machining plans prior to the start. This detects and avoids any program errors. The "perform simulation" work step before starting the production is not essential.

3. Workpiece blank

- One piece of round stock, AlCuMgPb material, material no. 3.1645; cut diameter 100 mm, thickness approximately 30 mm

4. Turning machine and machining plans

- SPINNER TC-600 turning machine equipped with SINUMERIK 840D sl and ShopTurn
- ShopTurn version 6.4 turning program (minimum equipment)
- 1SEITE.MPF machining plan for turning the lower side
- 2SEITE.MPF machining plan for turning the upper side
- Machining plans for milling the contour of the upper side

6. Turning the lower side

The cut blank is clamped securely.

Work steps on the turning machine

1. Approach the reference point of the machine.
2. Import the 1SEITE.MPF machining plan.
3. Enter measured tools in the tool list.
4. Place tools in the magazine.
5. Set workpiece zero point by scratching.
6. Perform simulation.
7. Start the manufacturing; process the machining plan.

7. Turning the upper side

The cut blank with the lower side to be machined is clamped securely.

Work steps on the turning machine

1. Approach the reference point of the machine.
2. Import the 2SEITE.MPF machining plan.
The contour programs must be located in the same directory.
3. Enter measured tools in the tool list.
4. Place tools in the magazine.
5. Set workpiece zero point by scratching.
6. Perform simulation.
7. Start the manufacturing; process the machining plan.

3-windows view simulation upper side

The screenshot displays the Siemens SINUMERIK 3-windows view simulation interface. The main window is divided into three sections: a top-left 2D side view of a part with a hole, a top-right 3D wireframe view of the part, and a bottom-right 3D solid model of the part. The 2D view shows a grey hatched part with a hole, and a blue tool is positioned above it. The 3D wireframe view shows the part's internal structure. The 3D solid model shows the part in a blue and grey color scheme. The interface includes a 'PROGRAM' header, a '3-windows view' title bar, and a 'Simulation active' status bar. The status bar displays coordinates (X 32.000 Z -11.502), spindle speed (C 180.000), feed rate (Feed), and time (10:51:59). The status bar also shows the current program (N85 001: Hole full cir.) and tool (T=DRILL_5_FA D1). The interface includes a 'Details' button, a 'Back' button, and a 'Simulation' button. The 'Simulation' button is highlighted in blue. The interface also includes a 'Strai. Circle' button, a 'Drill-ing' button, a 'Turn-ing' button, a 'Cont. turn.' button, a 'Mill-ing' button, a 'Vari-ous' button, and an 'Ex-ecute' button.
